The AI Web Company

Executive Summary — Prosper HealthTech Accelerator, Spring 2027

Patients now start their search for care inside AI assistants — asking ChatGPT, Claude, or Gemini who to see, who is taking new patients, and how to reach them. Healthcare organizations have no direct line into that conversation. They guess: paying agencies and visibility retainers, maintaining listings channel by channel, and losing inquiries to phone tag, web forms, and stale insurance directories. Administrative bottlenecks are where patient access goes to die.

AIWEB is the communications network for the AI era: a public directory of verified organizational pages that AI assistants can read, and a mailbox that lets any person, from any assistant or the open web, start a direct conversation with the organization — no app to install, no per-lead fee, one persistent thread with a receipt. The assistants are the phones. The AI web pages are the numbers. The AI Web is the network that makes them ring. The product is live, not a concept: AIWEB Call is an accepted plugin on ChatGPT; the same directory and two-way messaging were demonstrated across assistants on October 20, 2026, and the network's first organic healthcare inquiry — from a clinic seeking administrative FAQ and appointment communication — arrived on October 2, before healthcare was a target market.

The founder has worked this problem from inside the building. La Terrance “Terry” French studied biology on a pre-med track, then worked at the Audie L. Murphy VA Hospital in San Antonio as a patient escort in nursing services (2016–2017) and volunteered 1,200+ hours there, before founding and operating Life Over

Ethernet Technologies LLC (Seibertronics, 2017–2020), a healthcare IT company that served the same hospital under federal contract. An Army Signal Corps veteran (25U) with two decades in IT, he has since built the AIWEB network — roughly one million lines of code, largely solo — including its directory, calling, mail, and measurement systems.

The healthcare opportunity is the front door: make independent practices — dental, vision, and small specialty first — discoverable and directly reachable from AI assistants for general and administrative inquiries, with clinical communication explicitly out of scope until a HIPAA-ready architecture, business associate agreements, and partner-validated workflows exist. AIWEB complements the systems practices already run (scheduling, intake, EHR); it does not replace them. Incumbents validate the direction — Zocdoc's 2026 Care Access Network syndicates booking into Gemini and Amazon — while leaving the open, conversation-first endpoint unbuilt: Zocdoc sells bookings per patient; front-desk agent companies automate channels a practice already owns. Nobody sells the practice its own line into every assistant.

The business model is deliberately simple: listings are free, messaging is free, and organizations pay a flat mailbox subscription (currently $19.99–$500/month by tier). We do not sell patients as leads. The company is pre-revenue, with free users on the live network and a $500,000 pre-seed raise as the current target.

Prosper HealthTech is the right place to test the vertical: five teams, healthcare partners who can validate a front-door pilot's scope, and a Birmingham ecosystem anchored by UAB. Our program objectives: (1) launch scoped discovery-and-inquiry pilots with three to five partner practices; (2) define, with compliance

guidance, the HIPAA-ready tier of the network; (3) convert pilots into the company's first paying healthcare customers. We are not a healthcare company asking permission to enter technology. We are a communications network whose founder started in a hospital — asking to be introduced to the industry he came from.
